Library Claim | Hybrid architecture

Tushar Kalsi / Cozmo assessment / As implemented on 20 October 2026

Metric scale. LiDAR supplies depth in metres. Camera intrinsics and AR poses align confident depth with the observed object. Plane intersections measure book spines; RoomPlan polygons and oriented boxes supply room/furniture geometry. Camera-only mode leaves unsupported metric values unknown.

Price and truth boundaries. Search discovers URLs; server code accepts retrieved, dated offers and computes totals. Labels do not provide dimensions or prices. The local detector is a vision model, not a text SLM. Apple language-model, Claude and ElevenLabs paths are inactive in this build.

Evidence status. 362 Python tests and an unsigned iPhone build pass. The submitted capture is partial, independent ground truth is absent, and current cloud pricing is blocked by exhausted API credit. Full detail and failure analysis accompany this note.

Source: repository implementation; observed results are documented separately from design capabilities.
